• Analysis Model
The main objective of this project is to find the data insights from the huge amount of data that is evolving around us day by day. In order to analyze the data we need an architecture that is suitable for all kinds of data that we see in 21st century. We are using SPLUNK architecture for analyzing the data and getting the insights that we need for taking better decisions. SPLUNK is google for datacenters. By using SPLUNK we can generate all kinds of DASHBOARDS, ALERTS, SCHEDULING, PIVOTS and a lot more important things that is very usable for managers to take a better decisions. We use SPL language for manipulating the data.
1. It provides "better and efficient" service to members.
2. Reduce the workload of Data Analyst.
3. Faster retrieval of machine data and insights.
4. Provide facility for analyzing the data very fast and can manage load balancing.
5. Can create Dashboards, Pivots, alerts, and scheduling.
6. SPL (Search Processing Language) language is used for getting insights.
The functions of the system include the system providing different type of services based on the type of users.

- User accounts with login facilities.
- Can create dashboards for daily reporting easily.
- Easy to deploy and scalable to any size enterprise.
User Classes

The users of the system are

- Administrator
- Members

Assumptions

- The users should have sufficient knowledge of computers & of English language, as the user interface will be provided in English.
- The members should be either the student or faculty of the institute, where this s/w will be implemented.
Hardware Interface

• Processor: Pentium 3.0 GHz or higher
• RAM: 512 Mb or more
• Hard Drive: 10 GB or more

Software Interface

• Operating System : Windows 8
• Language : SPL
• Framework : Splunk Enterprise
Splunk Components

Data Presentation Layer – Search Head(s)

Universal Forwarder

Data Indexing Layer – Indexer(s)

Data Collection Layer - Universal Forwarders, syslog, API, TCP, Scripts, Wire, etc.
We’ll tackle these questions:

What is machine data?

Where can I get some?

What can I do with it?
What do most agencies use it for?

State & Local Government Use Cases

- Improve Constituent Engagement
- Mitigate Security Threats
- Deliver Better Eligibility Experience
- Reduce IT Costs
- Ensure HIPPA/PCI/FISMA Compliance
- Prevent Fraud
- Accelerate Transaction Processing
- Improve Operational Efficiency
Machine data is powerful

It’s available to you now

It has immense and immediate value

How you use it is up to your imagination
What is machine data?

- Logs files from computers and network devices
- Usage and Access Data from Personal electronics
- Data from sensors and remote metering devices

All of these produce data on their own.

Lots of data

Valuable data
Conclusion

Splunk offers a great platform for Web analytics with large logs and Data models with acceleration worked best for us. The business users interest in web analytics increased – More and more colleagues want access to Splunk to solve a problem. Learning to do it on your own is recommendable – Not yet easy to find good and available consultants in USA.
THANK YOU

WELCOME QUERIES
